

# AI Starts With Data Sovereignty, Not Technology

## Before AI, this sequence must happen:

1. **Get the data**

If you cannot extract it from vendors and systems, you do not truly control it.

2. **Organize the data**

AI cannot reason over chaos. Structure and clarity come first.

3. **Sanitize the data**

Define what is sacred, sensitive, private, and operational. Set risk appetite.

4. **Publicize internally**

Your people must know what data exists and how to use it.

5. **Utilize internally**

If humans are not using the data successfully, AI will not either.

## **Risk profile and sovereignty requirements drive architecture**

- Some data must remain fully under Tribal control
- Some data benefits from cloud scale and tooling
- Hybrid is often the natural outcome

**AI without data governance is a sovereignty risk**

**AI with strong data governance is a sovereignty amplifier**

Start with data. The right AI use cases will become obvious.
